

## **SPECIFICATION AMENDMENTS:**

Please replace paragraph [0032] with the following:

[0032] The storage volume in the container 12 is pressurized by the gas transferred from the pressurizing means 14. With the dispensing nozzle 16 in a condition preventing liquid flow out of the container [[19]] 12 (as further described below), the storage volume 22 can be gradually pressurized by the pressurizing means 14 to a desired pressure. The pressure imparted to the liquid in the storage volume 22 acts as the driving force to facilitate discharge of the liquid from the storage container out through the nozzle 16 (as further described below).
